SERMORELIN+6

The New Cutting-Edge Of Preventative Medicine.

When we're young, ample amounts of growth hormone releasing factor are produced so that the pituitary is able to provide the body with sufficient growth hormone to sustain health and vitality. However, as we age, growth hormone releasing factor declines causing reduced production and secretion of pituitary hGH often leading to a growth hormone insufficiency that erodes health, and diminishes vigor and vitality. Restoring optimal levels of growth hormone may improve or sustain good youthful anatomy, physiology, and thereby, the health and vitality often lost with age-related growth hormone deficiency.

Traditionally, adult growth hormone deficiency (AGHD) has been treated by substituting natural hGH with recombinant human growth hormone (rhGH). Although rhGH injections are still the standard for treating AGHD, a breakthrough product, SERMORELIN+6, offers a more natural, affordable alternative that is as effective as rhGH therapy.

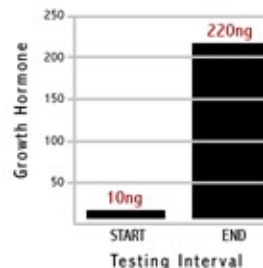

Developed in 1998 by Serono Laboratories, Inc., the makers of Saizen hGH, FDA approved Sermorelin has become available for the treatment of AGHD. Sermorelin is comprised of 29 amino acids found in the hormone (GRF 1-44) that your brain produces naturally to simulate the release of hGH. As a growth hormone releasing agent, Sermorelin triggers the pituitary gland to produce your own natural hGH.

In this natural process, your body regulates the level and frequency of hGH release, so there are no side effects associated with the constant application of injected rhGH. SERMORELIN+6 requires no off-cycles. In fact, the longer you use it, the better your pituitary gland functions, more like it did when you were younger.

Pituitary Stimulation Test

In November, 2007 at our South Florida Clinic, we initiated the case study of a 72 year old male showing symptoms of Adult Growth Hormone Deficiency. His initial Growth Hormone level was tested and recorded at 10ng. Next, 200mg IV Sermorelin was administered and, after 30 minutes, the subject's Growth Hormone levels were re-measured.

In this short period of time, Sermorelin had stimulated the subject's Pituitary gland to release 220ng of his own Growth Hormone - an astonishing 2200% increase. Continued therapy with Sermorelin will allow the subject to enjoy all the benefits of "youthful" pituitary function. Healthy growth hormone levels can help restore your vitality and improve your quality of life on every level.

Bottom line, SERMORELIN+6 effectively *re-starts* your natural hGH production to levels produced when you were younger. This not only provides the youth restoring benefits of hGH on body composition, it also helps sustain pituitary health and opposes loss of endocrine system activity that normally occurs with age.

Get on the fast track to better health and vitality!
